INDUSTRIAL ATHLETE DIGEST Weekly Wellness & Safety Tips from Work Right NW

IT'S COMPLEXUS

Ladies! Do you have the right support? Let's discuss. Women are more prone to experience thoracic pain in their lifetime than men. A study sampling 3,710 workers found that 17% of women in the workforce and 9% of men experienced thoracic pain. Although the prevalence of upper back pain is not as high as low back or neck pain in the worker, how is it 1 in 5 women experience it? Many reasons, but one major one being breasts!

THE ADDED WEIGHT OF **WOMANHOOD**

This anatomical feature in the female sex adds weight to the upper body and shifts the center of gravity forward. As this shift occurs, the rest of the upper body responds by an increased rounding of the upper back (kyphosis). Both the neck and shoulder blades respond by altering their positions, reducing shoulder range of motion, and changing the muscle length and activation capabilities of muscles. This change in positioning can be more problematic when breasts are larger or broader. In fact, breast volume was found to be the strongest predictor of upper back musculoskeletal pain.

THORACIC OUTLET SYNDROME

Not only do women have the added weight on top, but their skeletal system is also a bit different than men. The first rib, located at the base of the neck, sits more transverse in a woman than a man's inclined first rib. The collar bone sits just above the anterior portion of the rib and here is where the brachial plexus, a large bundle of nerves, passes through along with the subclavian artery and vein. It's called the costoclavicular space.

The costoclavicular space is one of the three areas where the brachial plexus, subclavian artery and vein can become compressed, causing Thoracic Outlet Syndrome (TOS).

Okay, this may all sound a little bit gloomy, but there is a way to help PREVENT upper back pain in women. We wouldn't talk about it if we couldn't prevent it!

1. Have the right support! Bras are so important for women's health! Consider these features when choosing the best bra for you - thicker straps, vertical or cross orientation, higher neckline, proper size.

2. Strengthen the scapulothoracic, shoulder, and neck muscles! You've learned that these muscles tend to get stretched out and weakened due the weight of breasts, so counter that by getting them strong enough to hold them! Try some of these exercises: Serratus Punches, Arm Lifts, Scapular Row, Chin Tucks
